

Keepass and Owncloud

The original Keepass2 client allows you to use webdav as storage backend for the keepass file where all the passwords are stored. however, it seems to be a bit tricky to get https to work with keepass2 under linux (ubuntu in my case).

there is one simple solution to all this, use [KeepassXC](#) which is a very nice kepass client and it supports webdav out of the box with no issues whatsoever.. also read my other article on [how to enable auto-unlocking the keepass db upon login and using it as a ssh key storage](#)

further more, install the [chrome plugin for keepassXC](#) to also use it as a password storage for your browser.
