SkyDemon on Linux (Ubuntu)

this is based on or copied from a Post in the skydemon forums

1. Install winetricks and wine

   ```
   sudo apt-get install winetricks
   ```

   (this will also install wine as a dependancy)

2. if you are running a **64bit Linux**, create a wine 32 bit prefix. i had some problems when i created a second prefix with 32bit.. since i don't need a 64 bit prefix anyway, i simply delted my .wine directory first

   ```
   rm -rf /home/username/.wine
   ```

   , and then recreated a 32bit prefix in .wine. (don't copy/paste, replace username with your user home directory name and use a direcotry other than .wine if .wine still exists and you want to keep your 64bit prefix. the directory must not exist yet!):

   ```
   WINEPREFIX='/home/username/.wine' WINEARCH='win32' wine 'wineboot'
   ```

3. run

   ```
   winecfg
   ```

   and simply click OK when it pops up

4. run

   ```
   winetricks dotnet40
   ```

   and follow the instructions (download the dotnet stuff and copy it to the folder they say and re-run the above command)
