

# Ubuntu Test Docker Image

the purpose of this docker image is, to be able to quickly start up some ubuntu containers with ssh access in a custom network in order to try out some client-server software. the software itself is not part of this image, as the idea is to simply install it inside the container for testing and then throw away the container once the tests are done.. this is not ment to be anymore than a locally run sandbox.

i used this to play round with different server backup solutions and try out restore procedures etc. on my laptop on the go for example.
